TEXT: Population Pressures

It is generally estimated that each year the world needs to house an additional 68 million to 80 million people. According to the United Nations Population Fund, world population passed 6.1 billion in 2001 and is expected to reach between 7.9 and 10.9 billion by 2050. Even more sobering, 98 percent of that growth during the next two decades is forecast to occur in developing countries. Those estimates in themselves represent a formidable housing challenge. Yet that challenge is further complicated by the fact that the fastest growing areas in most countries are the already overcrowded cities.

Major cities - such as New York, London and Tokyo - are often viewed as vital symbols of a country's economic growth. As a result, thousands of rural people annually flock to such 'greener urban pastures,' mainly to seek education and employment.

In China, for example, the economy is expanding rapidly. As a result, one report estimates, over the next few decades, more than 200 million new housing units will be needed in the major urban areas alone. That is almost twice the total number of housing units that currently exist in the entire United States. What housing program could possibly keep up with such demand?

According to the World Bank, "each year, some 12 to 15 million new households, requiring an equivalent number of dwellings, are added to the cities of the developing world". Since not enough affordable housing exists, these urban poor are forced to find shelter where they can, often where no one else chooses to live.
